Operating Manual

Monitor for speed, standstill and direction of rotation

DZ260, DZ261, DZ266, DZ267 und DZ269

Your partner for standard and special designs
- precise, reliable and fast -
Product features:

- Compact and most versatile monitor series for control of overspeed, underspeed, standstill and direction of rotation
- Logical monitoring of remote motion enable signals
- Universal inputs for connection to incremental encoders (TTL, RS422 or HTL), proximity switches, photocells remote TTL signals
- Extremely wide frequency range, operating from 0.1 Hz up to 1 MHz
- Easy setup by means of four keys and LCD menu
- All models include serial RS232 interface

1. Safety Instructions and Responsibility

1.1. General Safety Instructions

This operation manual is a significant component of the unit and includes important rules and hints about the installation, function and usage. Non-observance can result in damage and/or impairment of the functions to the unit or the machine or even in injury to persons using the equipment!

Please read the following instructions carefully before operating the device and observe all safety and warning instructions! Keep the manual for later use.

A pertinent qualification of the respective staff is a fundamental requirement in order to use these manual. The unit must be installed, connected and put into operation by a qualified electrician.

Liability exclusion: The manufacturer is not liable for personal injury and/or damage to property and for consequential damage, due to incorrect handling, installation and operation. Further claims due to errors in the operation manual as well as misinterpretations are excluded from liability.

In addition the manufacturer reserve the right to modify the hardware, software or operation manual at any time and without prior notice. Therefore, there might be minor differences between the unit and the descriptions in operation manual.

The raiser respectively positioner is exclusively responsible for the safety of the system and equipment where the unit will be integrated.

During installation or maintenance all general and also all country- and application-specific safety rules and standards must be observed.

If the device is used in processes, where a failure or faulty operation could damage the system or injure persons, appropriate precautions to avoid such consequences must be taken.

1.2. Use according to the intended purpose

The unit is intended exclusively for use in industrial machines, constructions and systems. Non-conforming usage does not correspond to the provisions and lies within the sole responsibility of the user. The manufacturer is not liable for damages which has arisen through unsuitable and improper use.

Please note that device may only be installed in proper form and used in a technically perfect condition and in accordance to the Technical Specifications (see chapter 11).

The device is not suitable for operation in explosion-proof areas or areas which are excluded by the EN 61010-1 standard.
1.3. Installation

The device is only allowed to be installed and operated within the permissible temperature range. Please ensure an adequate ventilation and avoid all direct contact between the device and hot or aggressive gases and liquids.

Before installation or maintenance, the unit must be disconnected from all voltage-sources. Further it must be ensured that no danger can arise by touching the disconnected voltage-sources.

Devices which are supplied by AC-voltages, must be connected exclusively by switches, respectively circuit-breakers with the low voltage network. The switch or circuit-breaker must be placed as near as possible to the device and further indicated as separator.

Incoming as well as outgoing wires and wires for extra low voltages (ELV) must be separated from dangerous electrical cables (SELV circuits) by using a double resp. increased isolation.

All selected wires and isolations must be conform to the provided voltage- and temperature-ranges. Further all country- and application-specific standards, which are relevant for structure, form and quality of the wires, must be ensured. Instructions about the permissible wire cross-sections for wiring are described in the chapter 11 “Technical Specifications”.

Before first start-up it must be ensured that all connections and wires are firmly seated and secured in the screw terminals. All (inclusively unused) terminals must be fastened by turning the relevant screws clockwise up to the stop.

Overvoltages at the connections must be limited to values in accordance to the overvoltage category II.

For placement, wiring, environmental conditions, as well as shielding and earthing/grounding of the supply lines, the general standards of industrial automation industry and the specific shielding instructions of the manufacturer are valid.

1.4. Cleaning, Maintenance and Service Notes

To clean the front of the unit please use only a slightly damp (not wet!), soft cloth. For the rear no cleaning is necessary. For an unscheduled, individual cleaning of the rear the maintenance staff or assembler is self-responsible.

During normal operation no maintenance is necessary. In case of unexpected problems, failures or malfunctions the device must be shipped back to the manufacturer for checking, adjustment and reparation (if necessary). Unauthorized opening and repairing can have negative effects or failures to the protection-measures of the unit.
2. Introduction
This new series of monitors has been designed as control modules for mounting inside of electric control cabinets. The units are suitable for speed monitoring of machines, signalling overspeed, underspeed, zero motion and the direction of rotation. Units providing an analog output can moreover be used for closed-loop control or feedback purpose within a control system.

Very special advantages of these new monitors are the wide frequency range, the extremely fast response and the remarkable versatility with regard to possible input formats and programmable monitoring functions.

3. Available Models
There are five models available, all with fully similar basic functions, but with different options concerning the outputs.

- **DZ = Function: Speed Monitor**
- **26 = Housing with dimensions 72 x 91 mm (2.835 x 3.583 ")**, with LCD and keypad
- **0 = Analogue output + 3 relay outputs**
- **1 = Analogue output + 3 transistor outputs**
- **6 = Analogue output only**
- **7 = Relay outputs only**
- **9 = Transistor outputs only**

</table>
4.6. Power Supply

The units require a DC supply from 17 to 30 V which must be applied to terminals 1 and 2. Depending on the input voltage level and internal states, the power consumption may vary and lies in a range of about 70 mA with a 24 V input (plus encoder currents taken from the auxiliary voltage output).

4.7. Auxiliary Output for Encoder Supply

Terminals 4 and 3 provide a +5.2 VDC / 200 mA auxiliary output for supply of encoders and sensors.

4.8. Impulse Inputs for Encoders and Sensors

The setup menu of the unit allows individual setting of the desired characteristics of the signal inputs. According to the application the units will accept single-channel signals (input A only with no direction information) as well as dual channel signals A/B including information of the direction of rotation. The following input formats and levels are acceptable:

- symmetric differential input with RS422 format A, /A, B, /B
- asymmetric (single-ended) TTL levels (A and/or B only without inverted channels)
- HTL level 10 ... 30 V, alternatively differential (A, /A, B, /B) or single-ended (A and B only, without inverted channels)
- Signals from proximity switches or photocells providing HTL level (10 ... 30 V)
- NAMUR (2-wire) signals

4.9. Control Inputs

Two programmable control inputs allow the assignment of functions like remote start-up-delay, reset of relay lock, hardware interlock of the keypad and similar.

Both inputs provide PNP characteristics and require HTL level. Also it is possible to set the control function to "active LOW" or "active HIGH".

For evaluation of dynamic events the desired "active edge" can be set (rising or falling edge).
4.10. Serial Interface

The serial RS232 interface in general may be used

- for easy setup and commissioning of the units (with use of the OS32 operator software)
- to change settings and parameters by PC or PLC during the operation
- to read out internal states and actual measuring values by PC or PLC

The subsequent drawing shows how to link the monitor with a PC, using the standard 9-pin SUB-D-9 connector

4.11. Relay Outputs K1 – K3 (DZ260 and DZ267 only)

The units provide three programmable relay outputs (all dry changeover), providing a switching capability of 30 V / 2 A DC or 125 V / 0.6 A AC or 230 V / 0.3 A AC. Both, switching characteristics and monitoring function may be programmed for each of the relays individually.

4.12. Transistor Outputs K1 – K3 (DZ261 and DZ269 only)

The units provide three outputs with programmable switching characteristics. K1 – K3 are fast-switching and short-circuit-proof transistor outputs with a switching capability of 5 ... 30 V / 350 mA each. The switching voltage of the outputs must be applied remotely to the Com+ input (terminal 22). Both, switching characteristics and monitoring function may be programmed for each of the outputs individually.

4.13. Scalable Analog Output (DZ260, DZ261 and DZ266 only)

The units provide a voltage output with a +/-10 V range (max. load 2 mA) and a current output with ranges 0 / 4 ... 20 mA (burden 0 – 270 Ohm), however only one of the two can be used at a time. Beginning and end of the desired conversion range can be set by the operator menu (see section 7.2.7). The common potential of both outputs refers to GND.

The total resolution is 14 bits. A settling time of approx. 200 µs. is required. The overall response time of the analog outputs primarily depends on the selected Sampling Time setting. After volatile jumps of the input signal, the analog outputs may need up to two Sampling Time cycles (plus 200 µsec.) to stabilize.

Important note: “voltage out” and “current out” must not be used together. Please do never connect mA and V simultaneously!
5. LCD Display and Keys

The units provide a back-lit LCD display with 2 lines at 16 characters each, and four keys for setup and command control.

During the setup procedure the LCD display indicates the menu with all parameter texts and the set values of the parameters.

During normal operation, the LCD display indicates the following information:

- **Actual speed value**
- **Input frequency, scaled in user units**
- **Analogue output** (not with DZ267, DZ269)
- **Actual output level in % of full scale**
- **O: Outputs** (not with DZ266)
- **Actual switching states of relays/transistor outputs**
  - (Rel1, Rel2, Rel3)/(out1, out2, out3)
  - C = Closed, O = Open
- **I: Inputs**
- **Actual logical state of inputs**
  - (Control1, Control2)
  - L = Low, H = High

The "Display Menu" allows free scaling of the speed measuring values and the speed-related parameters to any kind of engineering units.
6. Keypad Operation

A summary of all parameters and a detailed description of parameter functions is available under section 6.

For all operation, the units provide four keys which subsequently will be named as shown below:

<table>
<thead>
<tr>
<th>P</th>
<th>←</th>
<th>→</th>
<th>←</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROG</td>
<td>UP</td>
<td>DOWN</td>
<td>ENTER</td>
</tr>
</tbody>
</table>

The key functions depend on the actual operating state of the units. Basically we have to distinguish between Normal Operation and Setup Operation.

6.1. Normal Operation

While in normal operation state, the units monitor the speed according to the selected operational parameters and settings. Each of the front keys provides the command functions as attached to it upon setup in the "Command Menu".

6.2. Keypad Interlock

There is a 3-stage conception to protect the keys against unauthorized changes of the configuration respectively against activation of commands.

<table>
<thead>
<tr>
<th>Stage</th>
<th>Protected Range</th>
<th>Protection by</th>
<th>Key Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>---</td>
<td>---</td>
<td>Change of Parameters</td>
</tr>
<tr>
<td>2</td>
<td>Menu</td>
<td>Password upon activation of menu</td>
<td>Protection of selectable parts of the menu via password</td>
</tr>
<tr>
<td>3</td>
<td>Keyboard</td>
<td>Hardware-Latch 1</td>
<td>interlocked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Hardware Latch 2</td>
<td>All functions interlocked</td>
</tr>
</tbody>
</table>

The "Key Pad" menu allows to define an individual password for each group of parameters. This function can be used to provide individual access rights to different operators. Upon access to an interlocked section the unit asks for the corresponding password. If the correct password is not entered in time, the unit denies access and automatically returns to normal operation.

The hardware latch function can be activated and deactivated by one of the Control Inputs, or by means of serial access to the corresponding locking register.

Using the Hardware Latch function may accidentally cause a total locking of all functions, when the Control Inputs characteristics have been set inauspiciously. In this exceptional case you can release the key functions again by either:

a) applying the correct logical state (High or Low) to the inputs
b) or resetting the parameters to their default values (see section 6.6)
c) or change the parameters being responsible for the locking by PC
6.3. General Setup Procedure

To change over from normal operation to the setup state, please keep down the PROG key for at least 2 seconds. After this the menu appears and you can select one of the menu groups. Inside each group you can select the desired parameter and edit the setting according to need. After this you are free to edit more parameters, or to return to normal operation.

The function of the different keys during setup is shown in the table below.

<table>
<thead>
<tr>
<th>Key</th>
<th>Menu Level</th>
<th>Parameter Level</th>
<th>Setting Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROG</td>
<td>Save settings and return to normal operation</td>
<td>Return to Menu Level</td>
<td>Check entry, store result, then go back to Parameter Level</td>
</tr>
<tr>
<td>UP</td>
<td>Switch over to next menu</td>
<td>Select next parameter</td>
<td>Increment the highlighted digit or scroll the setting upwards</td>
</tr>
<tr>
<td>DOWN</td>
<td>Go back to previous menu</td>
<td>Select previous parameter</td>
<td>Decrement the highlighted digit or scroll the setting downwards</td>
</tr>
<tr>
<td>ENTER</td>
<td>Switch over to the Parameter Level of the current menu</td>
<td>Switch over to Setting Level</td>
<td>Shifts the highlighted digit one position to the left, or from utmost left to utmost right</td>
</tr>
</tbody>
</table>

6.4. Changing Parameters on the Setting Level

With signed parameters, the front digit can only be changed between “+” (positive) and “−” (negative). The subsequent example explains how to change a parameter from originally 1024 to a new value of 250 000.

The example assumes that you are already on the Setting Level, i.e. you have already selected the corresponding parameter and read its actual value on the display. Highlighted (blinking) digits are marked by background colour and indicate the cursor position.
The actual value 1024 is displayed, with the last digit blinking.

Change last digit to 0

Shift cursor to left

Change highlighted digit to 0

Shift cursor to left by 2 positions

Change highlighted digit to 0

Shift cursor to left

Change highlighted digit to 5

Shift cursor to left

Change highlighted digit to 2

Save new setting and return to Parameter Level

---

6.5. Return from the Menu, Time-Out Function

At any time the PROG key changes the Menu by one level backwards or fully back to the normal operation mode. The menu also switches automatically one level backwards, every time when for 10 seconds no key has been touched (Time-Out-Function).

6.6. Reset all Parameters to Factory Default Values

If applicable, the whole set of parameters can be reset to factory default values (e.g. because a code for the keypad interlocking has been forgotten, or because the unit does no more work correctly for reasons of bad settings). All default values are indicated in the following parameter tables.

To execute this Reset procedure, you have to take the following steps:

- Power the unit down
- Press \( \downarrow \) and \( \uparrow \) simultaneously
- Switch power on with both keys held down

When execute this action, please be aware that all parameter settings will be lost and the whole setup procedure must be repeated!
7. Menu Structure and Parameter Description

All parameters are combined to groups, arranged in several menus. Settings are only necessary for parameters which are really relevant for the individual application.

7.1. Survey of Menus

This section provides an overview of the menus and their assignments to the different functions of the units. The menu names are printed bold, and associated parameters are arrayed directly under the menu names.

Menu texts are in English language, according to the presentation on the LCD display.

(*** partially inactive with DZ266
7.2. Parameter Descriptions

7.2.1. Preselection’s

*Preselection parameters are not relevant for model DZ266*

These parameters assign the desired switching points to the relays/outputs. The preselection’s use the same engineering units as the display of the actual speed (see Display Menu).

<table>
<thead>
<tr>
<th>Preselection Menu</th>
<th>Code</th>
<th>Setting Range</th>
<th>Default</th>
</tr>
</thead>
<tbody>

<tr>
<td>1 forward when B leads A</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(*) With settings HTL / NPN the input terminals are connected to the power supply voltage of the unit (±24 V) via internal pull-up resistors. For this reason it is advisable to first set the encoder properties correctly, prior to connecting TTL encoders to the unit.

Setting HTL / NPN is also suitable for use with NAMUR (2-wire) proximities, (connect the positive wire of the sensor to the input terminal and the negative wire to GND)
Encoder-Menu | Code | Setting Range | Default
--- | --- | --- | ---
Sampling Time | „A2“ | 0.001..9.999 | 0.001
Internal time base for sampling of the input frequency (sec.)
Wait Time | „A3“ | 0.01..9.99 | 1.00
Time to wait before unit detects zero speed (sec.)
Impulse distances greater than this time will be taken as zero
Filter | „A4“ | 0.7 | 0
Digital filter for smoothing of unstable frequencies
0 | Filter off (very fast response to frequency changes)
1 | T (63%) = 1.9 msec. with Sampling Time = 1msec.
2 | T (63%) = 3.8 msec. with Sampling Time = 1msec.
7 | T (63%) = 122 msec. with Sampling Time = 1msec.
Set Value | „A5“ | -1 000 000.0 ... +1 000 000.0 | 0
Fixed frequency set value for encoder simulation (Hz)
(see also "Command"-Menu)

### 7.2.3. Serial Readout Menu

An actual value proportional to the input frequency can be read out via serial link, accessing the serial readout register (code „B“). As a Basic Value this register uses the scaling set for the analog output, i.e. a range from 0 to 10 000 units corresponding to 0 - 100.00 % of the full scale output (see section 7.2.7 "Analog Menu"). This readout can still be rescaled to user-friendly engineering units, using the following parameters:

Serial Readout Menu | Code | Setting Range | Default
--- | --- | --- | ---
Multiplier | „A8“ | -9.9999 ... +9.9999 | +1.0000
Divider | „A9“ | 0.0000 ... 9.9999 | 0.0000
Offset (absolute term) | „B0“ | -99999999 ... +99999999 | 0

\[
\text{Readout (} \times \text{) = Basic Value } \times \frac{\text{Multiplier}}{\text{Divider}} + \text{ Offset}
\]

- The definition of the "Basic Value" occurs in the "Analog Menu" and is also available for the DZ67 units without analog output
- the ratio Multiplier / Divider must never be greater than 15 000
- Setting "Divider" to zero will skip the rescaling procedure, resulting in a shorter response time with all functions of the unit

More details about serial communication can be found in the appendix.
### 7.2.4. Special-Menu

<table>
<thead>
<tr>
<th>Special-Menu</th>
<th>Code</th>
<th>Setting Range</th>

<td><strong>Anologue ABS</strong></td>
<td></td>
<td>0...1</td>
<td>0</td>
</tr>
<tr>
<td>Only positive voltage values are displayed.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Please note: Independent of the parameters Analogue Start and Analogue End, only positive values are displayed. At normal case (Analogue ABS=0) the displayed voltage value is for example -1,234V. If Analogue ABS=1, in this case 1,234V would be displayed.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The settings above are at the same time used to generate the Basic Value 0 - 10 000 (corresponding to 0 - 100,00 %), which finally can be read out from the serial register with access code „8“ (see 7.2.3)

*) Example: If a display range of -250 to +250 must output a proportional analog range from -10 V to +10 V, the “Analog Start” parameter must be set to 0 and the “Analog End” value to +250.
7.2.8. **Serial Menu**

Serial transmissions will operate in either the “PC Mode” or in “Printer Mode”.

With “PC-Mode”, the unit receives a request string and responds with a corresponding data string. For details of the protocol see separate description “SERPRO”.

With “Printer Mode” the unit sends data without any request and under Timer control as described subsequently.

As soon as the unit receives a character, it automatically switches over to PC Mode and operates according to protocol. When for a period of 20 sec. no character has been received, the unit switches automatically back to “Printer Mode” and starts cyclic data transmission again.

<table>

### Serial -Menu (Configuration of the serial link)

<table>
<thead>
<tr>
<th>Code</th>
<th>Setting Range</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>„F3“</td>
<td>0 ... 1</td>
<td>0</td>
</tr>
</tbody>
</table>

#### Serial Protocol

Determines the sequence of characters sent, when you use the serial output for cyclic data transmission under timer control (xxxxxxxx is the measuring value transmitted).

- 0: Transmission = Unit Nr. – Data, LF, CR
- 1: Transmission = Data, LF, CR

Setting "1" removes the unit address from the string which allows a slightly faster transmission cycle.

<table>
<thead>
<tr>
<th>Unit No.</th>
<th>Code</th>
<th>Setting Range</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:</td>
<td>1 1</td>
<td>+/- X X X X X LF CR</td>
<td></td>
</tr>
<tr>
<td>1:</td>
<td>+/- X X X X X LF CR</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Serial Timer

This register determines the cycle time in seconds for cyclic transmission when the Printer Mode is switched on.

With setting “0” all cyclic transmission is switched off and the unit will only send data upon request (PC mode).

<table>
<thead>
<tr>
<th>Code</th>
<th>Setting Range</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>„F4“</td>
<td>0 ... 9.99</td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

*) f = Input frequency in Hz

With display modes 2 – 4 also the switching point settings will use the same engineering units as set for the display
8. Example for Commissioning

The following example is to explain setup and commissioning of the units with a typical application.

- A tooth wheel with 32 teeth should be monitored with respect to speed and standstill
- For speed pick-up we use two proximity switches "Namur-type", which for detection of the direction of rotation are mechanically displaced to generate an impulse offset
- Relay 1 should signal "standstill" when one second after detection of "zero frequency" no further input impulse has been registered
- Relay 2 should generate a timed output pulse of 0.3 seconds when the speed drops below 100 RPM in either forward or reverse direction.
- Relay 3 should switch on and catch when, with forward direction only, the speed exceeds 300 RPM. With reverse direction relays 3 should not respond at all
- Release of the relay 3 catch state should be possible by either a positive signal applied to input "Control1", or by activating the ENTER key.
The table below shows the setup procedure for an application according to the previous example. Parameters which are not mentioned are optional, but not relevant for this function.

9. Appendix

9.1. Hints for Use of the Linearization Function

The linearization function of these units allow to convert a linear input frequency into a non-linear developing, which can be indicated on the LCD display and which is also available as analog signal or as serial data, for further processing.

There are 16 programmable x/y coordinates available, which can be set in any desired distance over the full conversion range. Between two coordinates, the unit uses linear interpolation. Therefore it is advisable to use more coordinates in a range with strong curves and only a few coordinates where the curvature is less.

To specify an individual linearization curve, the „Linearisation Mode” register must be set to either 1 or 2.

The registers P1(x) to P16(x) are used to specify the coordinates on the x-axis. These are the measuring values that the unit normally would generate according to the actual input frequency. These settings must be in % of full scale.

Now enter the attached values to registers P1(y) to P16(y). These are the values that the unit will generate instead of the x-values, i.e. P2(y) will substitute P2(x) etc.

- x-registers must use continuously increasing settings, i.e. P1(x) must have the lowest and P16(x) must have the highest setting.
- All entries use a percental format of xx.xxx% full scale. Setting 000,000 % means zero output and setting 100,000 % means full scale output.
- With Linearisation Mode set to 1, it is a must to set P1(x) to 0 % and P16(x) to 100 %. Linearisation is defined in the positive range only and the negative range will be a mirror image of the positive range with reference to zero.
- With Linearisation Mode set to 2, it is a must to set P1(x) to -100 % and P16(x) to +100 %. This enables the user to set curves which are not symmetric to the zero position.
9.2. Data Readout via Serial Interface

All register codes shown in the "Serial Menu" are available for serial readout by PC or PLC. For communication the monitors use the Drivecom Protocol according to ISO 1745. All protocol details can be found in our manual SERPRO_2a.doc which is available for download from our homepage www.motrona.com.

To request for a data transmission you must send the following request string to the converter:

```
<table>
<thead>
<tr>
<th>EOT</th>
<th>AD1</th>
<th>AD2</th>
<th>C1</th>
<th>C2</th>
<th>ENQ</th>
</tr>
</thead>
<tbody>
<tr>
<td>EOT = control character (Hex 04)</td>
<td>AD1 = unit address, High Byte</td>
<td>AD2 = unit address, Low Byte</td>
<td>C1 = register code, High Byte</td>
<td>C2 = register code, Low Byte</td>
<td>ENQ = control character (Hex 05)</td>
</tr>
</tbody>
</table>
```

The following example shows the request string for readout of the actual input frequency of a monitor (code:9) from a unit with unit address 11:

**ASCII Code:**

<table>
<thead>
<tr>
<th>ASCII Code:</th>
<th>EOT</th>
<th>AD1</th>
<th>AD2</th>
<th>C1</th>
<th>C2</th>
<th>ENQ</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hex Code:</td>
<td>04</td>
<td>31</td>
<td>31</td>
<td>3A</td>
<td>39</td>
<td>05</td>
</tr>
<tr>
<td>Binary Code:</td>
<td>0000 0100</td>
<td>0011 0001</td>
<td>0011 0001</td>
<td>0011 1010</td>
<td>0011 1001</td>
<td>0000 0101</td>
</tr>
</tbody>
</table>

After a correct request, the unit will respond:

```
<table>
<thead>
<tr>
<th>STX</th>
<th>C1</th>
<th>C2</th>
<th>xxxx</th>
<th>ETX</th>
<th>BCC</th>
</tr>
</thead>
<tbody>
<tr>
<td>STX = control character (Hex 02)</td>
<td>C1 = register code, High Byte</td>
<td>C2 = register code, Low Byte</td>
<td>xxxx = readout data</td>
<td>ETX = control character (Hex 03)</td>
<td>BCC = block check character</td>
</tr>
</tbody>
</table>
```

For all further details see SERPRO_2a.doc.
9.3. “Relay Action”, override relay states by programmed states

Models providing relay outputs allow to temporary change the actual relay states according to a programmable ON / OFF pattern, or to temporary freeze the actual switching states. These override functions can be activated by either touching a front key or by a remote command.

9.3.1. Override relay/output states by programmable ON / OFF states

Parameter “Relay Action” allows to select which of the relays/outputs should be affected by the override action. Parameter “Action Polarity” provides setting of the desired “ON / OFF” pattern (see section 7.2.9, “Switching Menu”). The desired way of activation this override command can be set by the “Command-Menu” (see 7.2.6).

Application example:
You would like to temporary de-energize relays K1 and K3 by touching the key “UP”, whilst relay K2 should continue to function normally.

<table>
<thead>
<tr>
<th>Action</th>
<th>Parameter settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Assign the Override Command to key “UP” Key Up Func. = 2</td>
</tr>
<tr>
<td>2</td>
<td>Select relays/outputs K1 and K3 Relay Action = 5</td>
</tr>
<tr>
<td>3</td>
<td>Set the desired switching state of the relays/outputs (both de-energized) Action Polarity = 2</td>
</tr>
</tbody>
</table>

9.3.2. Freeze the actual switching state of all relays

This function will temporary freeze all relays in their actual state for the duration where you press a key or apply a remote command. During the freeze period the relays will no more follow any changes of the input frequency

Application example:
You would like to freeze all relays by applying a “High” signal to input “Control1”

<table>
<thead>
<tr>
<th>Action</th>
<th>Parameter settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Assign the Freeze command to input “Control1” Input 1 Func. = 2</td>
</tr>
<tr>
<td>2</td>
<td>Set the input to “Active High” characteristics Input 1 Config = 1</td>
</tr>
<tr>
<td>3</td>
<td>Assign the “Freeze relays” function to the input Relay Action = 8</td>
</tr>
</tbody>
</table>

- These commands will override the switching states of the selected relays/outputs. All relays/outputs will immediately return to the actual control state after removing the override command. All internal measuring and control cycles will continue normally.
- To use these functions, please set the corresponding key and input characteristics to static operation only, since dynamic (edge-triggered) operation would make no sense.
9.4. Monitoring of remote motion enable signals

The unit provides a special “Command Monitor” function for logical control of a motion enable signal and the resulting response of the system. In addition to the normal monitoring functions this mode is suitable to generate alarm outputs under any of the following conditions:

- motion is disabled, but still the system moves
- motion is enabled, but the system does not move at all (mechanical deadlock), or the system does not reach the scheduled speed within an expected time (overload)
- the motion command changes over from "enable" to "disable" but the system does not come down to standstill within an expected time

The following parameter settings will activate the Command Monitor function:

9.4.1. Definition of a speed window

The application requires one of the relays to operate in overspeed mode (Preselect Mode = 0) and another relay to operate in underspeed mode (Preselect Mode = 1). This will define a window for the expected speed under regular motion conditions (see 7.2.9)

9.4.2. Assignment of a control input

One of the two control inputs has to be set to the control function “12” to activate the monitoring of the command. This input must be connected to the remote Enable/Disable signal (see parameters "Input Function" under 7.2.6)

9.4.3. Assignment of the control polarity

Parameter "Input Config" provides setting of the input polarity as follows:

- Input Config = 0  =>  Motion disabled (stop) corresponds to input level "LOW"
  Motion enabled (run) corresponds to input level "HIGH"

- Input Config = 1  =>  Motion disabled (stop) corresponds to input level "HIGH"
  Motion enabled (run) corresponds to input level "LOW"

9.4.4. Setting of a Start-up delay time

Any signal changes from "disable" to "enable" or vice-versa will require some delay until the system could really follow the command (acceleration or deceleration). Therefore it is mandatory to set an appropriate start-up delay time (to the relay/output responsible for "underspeed" only). See section 7.2.9 “Start Up Mode” and “Start Up Relay”.

9.4.5. Setting of an appropriate Standstill definition

Under parameter "Standstill Time" an appropriate time must be set (see section 7.2.9).

- The command monitor uses always the same relay/transistor output to which the underspeed function has been assigned.
- It is important to set a time higher than the Start-up delay time!
- While the command monitor function is active, you can see an indicator box in the PV/PO column of the PC screen. The "Command Monitor" box shines blue when the motion command is in "Disable" state.
10. Dimensions:

- Front view:
  - 72.0 mm (2.835")

- Side view:
  - 91.0 mm (3.583")
  - 33.0 mm (1.299")
  - 51.0 mm (2.001")
  - 76.0 mm (2.992")
