## About us

---

Hohner Elektrotechnik GmbH was founded in 1980 in Werne an der Lippe, a beautiful small town on the edge of the Münsterland.

Hohner has been a specialist in the design and manufacture of pulse encoders and its associated application possibilities. Therefore, to this day, the main task of the company still consists of producing high-quality products and, above all, putting reliable Hohner products on the market.

In order to meet the ever increasing market requirements, optimum logistics ensure short delivery times.

## Pulse encoders - Function and benefits

---

Incremental and absolute rotary encoders are used to measure angles, distances and speeds. They serve thus as an interface between the mechanically and electrically measured variable in a control loop, and are mainly used in automation technology. The electrically measured variable generated is prepared in such a way that it can be evaluated directly by the PLC (Programmable Logic Controller), a control computer or even a simple counter card.

A contactless optical scanning of a measuring body (pulse disc) in transmitted light procedure applies to all Hohner encoders.

An LED emits infrared light through a sampling grid. By moving the measurement body, the light is interrupted rhythmically and measured via receiver elements. The downstream electronics shapes and amplifies the signals thus generated. Dividing the measuring body into a certain number of equal parts (increments) enables optimum evaluation.

Hohner uses as measuring body high-grade plastic pulse discs with extremely high temperature resistance and high shock resistance.

The scale is attached onto the plastic carrier with a special photo-technical procedure designed by Hohner. This technology allows the production of any number of pulses or division to the maximum value of the respective series.

# Incremental Rotary Encoders

## General description

Incremental rotary encoders are sensors for detecting rotary movements. An optoelectronic scanning unit converts the division (circular disc with light and dark fields, also referred to as increments) supplied by a measuring body into a proportional number of electronic pulses. The number of output pulses is a measure for the angle of the encoder. The subsequent electronics used by the user enable the measuring of angles, distances or speeds. Different signal outputs and output circuits are available for adapting to the controls used.

## Signal outputs

Two square pulse trains offset by 90° el, with channel A lagging in clockwise rotation.

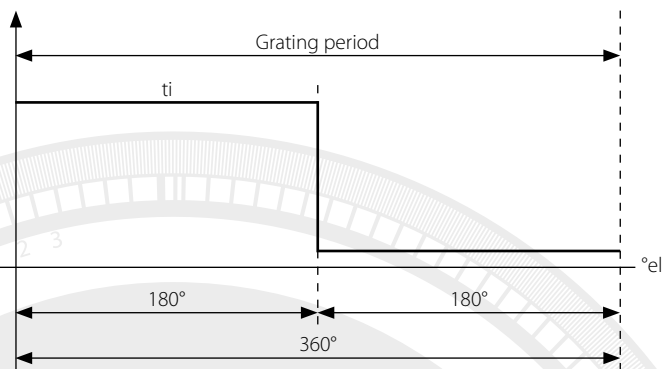

Reference pulse 0 once per revolution, position and length optional, linked for RS 422.

All output signals measured against GND!

All channels can also be executed inversely.

## Pulse and Phase tolerance

### Puls tolerance

$t_i : t_p$  180° el: 180° el ± 10%

### Phase tolerance

90° el ± 10%

## Calculation of permissible speed

$$n \left( \frac{u}{\min} = \frac{f_{\max} \text{ (Hz)}}{\text{No. of pulses}} \right) \times 60$$

Attention: Observe permissible mechanical speed

## Power supply

$$U_B = 5 \text{ V DC} \pm 5\%$$

$$U_B = 10 \text{ V} \dots 30 \text{ V DC}$$

The limits of supply voltage, including the residual ripple, may not be exceeded as this could cause malfunctions, or damage the device.

## Output circuits

- 0 Darlington Driver  
ULN 2003 o.ä.  
max. 40 mA per channel  
short-circuit-proof

- 1 Push-pull –

max. 1.6 mA per channel  
(1 TTL load)

- 6 Driver according to E/A standard  
RS 422  
AM 26 LS 31 C  
DS 26 C 31 C or sim.

# Incremental Rotary Encoders

## Alarm output

Output circuit

## Technical data

<b>Output</b>	NPN - Open collector
<b>Output load max.</b>	5 mA/24 V at $U_B = 5 \text{ V DC}$ 5 mA/32 V at $U_B = 10 \dots 30 \text{ V DC}$
<b>Level</b>	Output active (fault): L 0.7 V DC Output inactive: high impedance (H level, possibly via external pull-up resistor)
<b>Error reporting period</b>	• 20 ms

## Function

The rotary encoders with alarm outputs are equipped with monitoring electronics reporting essential operating errors via a separate output. The alarm output can be used for selecting an optical control (LED; for circuit, see above) or the control system (PLC or similar). The alarm outputs of several encoders can also be interconnected by parallel connection to a common "System alarm".

The following errors are reported:

Category I	Category II	Category III
- Glass breakage	- Overtemperature $1 \text{ V DC} < U < 4 \text{ V DC}$	Voltage range
- Defective LED	- Overload e.g. due to short circuit	- Voltage drop on the supply lines
- Contamination		

**Category I errors** cannot be remedied; replacing the encoder is necessary.

**Category II errors** are detected by means of a thermal monitoring unit in the electronics. The error message expires after removing the cause for the temperature increase.

**Category III errors** indicate an insufficient power supply. This category also reports short-term disturbances of the power supply, e.g. due to electrostatic discharges, which may distort the output signals. Remedial action ensues by intercepting the interfering effects, e.g. by carefully selecting the cable routing.

**Cable lengths (AWI 58 H)**

Output RS 422 (R)	depending on output voltage and frequency (at 25°C)	
	length	RS 422
	10 m	5 V DC, 300 kHz

# Series MIG Nova+

## Series MIG Nova+

- ▶ Compact design; 7 - 15 mm thick
- ▶ Standard flanges sizes from 80 to 450 mm
- ▶ Compatible with any IEC standard motor, size 56 to 225
- ▶ Space-saving and protective assembly between motor and gearbox; protection class IP67
- ▶ Also applicable to existing drives
- ▶ Epoxy resin sealed encoder electronics
- ▶ Unbreakable vulcanized magnet ring
- ▶ 1 - 2048 impulses (A 90°B) per revolution
- ▶ Contactless signal measurement
- ▶ Output signal A 90° B and inverted
- ▶ Up to 6000 rpm.
- ▶ Line driver output, 10 - 24 VDC and TTL 5 VDC
- ▶ Flange material in aluminum and available in stainless steel
- ▶ Special construction and material on request
- ▶ Standard with 2 m, screened cable.  
Different lengths and plug connection on request.

### Electrical specifications

Connecting voltage $U_b$ :	5 to 24 VDC
Max. impulse frequency:	$\leq 100$ kHz
Output signals:	Square wave-impulses, A 90° B and A 90° B inverted
Impulses:	1 ... 512, 1.024, 2.048
Signal level:	$U_{high} \geq U_b - 0,7$ V at $I_{last} \leq 10$ mA $U_{low} \leq -0,7$ V at $I_{last} \leq 10$ mA
Output capacities:	$\leq 30$ mA at $U_b = 10$ V DC or $\leq 20$ mA at $U_b = 24$ V DC
Output switching:	Line-Driver (Push-Pull)
External evaluation:	NPN, PNP, RS422
Reversepolarity protected:	Yes
Short circuit protection at the output:	Yes
Motor shaft tolerance:	0,2 mm axial - 0,05 mm radial

### Mechanical specifications

Max. speed:	6.000 min <sup>-1</sup> (1.024 impulses) 3.000 min <sup>-1</sup> (2.048 impulses)
Temperature range:	-30° C to +80° C
Flange/hub material:	Aluminium, stainless steel (additional price) / Magnet vulcanized
Connection cable:	PUR-sheath 6 x 0,14 screened (A+B, A+B inv.) Standard 2 m or on request
Cable length:	Depending on the impulses and RPM max. 100 m at 5 V DC max. 20 m at 24 V DC max. 50 m at 24 V DC and impulse frequency max. 50 kHz
Protection type:	Standard IP55, depending on the sealant used between motor and machine flange IP67. Please take note in the operating manual.

# Series MIG Nova+

## Series MIG Nova+

The very compact **MIG Nova+** encoder flange is available with pulses from 1 to 2048 per revolution and has a revolutionary vulcanized magnet ring. The flange has standard dimensions and therefore fits on every IEC motor. With a minimum thickness of 7 mm, your drive is only a fraction longer and the epoxy resin sealed encoder electronics is completely protected from external influences. Extremely suitable for the „wet applications“ such as the food, dairy and fish processing industry.

**IEC flange design**

# Absolute Rotary Encoders

## General descriptions

Absolute rotary encoders are optoelectronic sensors collecting and encoding angles or distances. A digitally coded value is assigned to each measuring step defined by the division on a measuring body (code disk). This absolute measured value can be read as often as desired, is reproducible and not corrupted by power failures.

The one-step gray code is basically used with the code disk (measuring body). The one-step coding has the advantage of avoiding intermediate values while measuring step changes.

## Output codes

### Gray code

This is a one-step format code whose individual positions have no significance. Only 1-bit changes during measure value change thus avoiding intermediate values that can occur in multi-step output codes. The number of positions to represent a position value corresponds to those of the binary codes.

### Gray excess codes

The one-step coding of the gray code applies to resolutions that can be represented as potency (x) to the base 2 ( $2^x$ ). A central part is taken from the gray code for other resolutions, which guarantees that the one-step coding is maintained. This output code is known as gray express code.

It should be observed that the representation range no longer begins at "0", but shifts by a certain value (e.g. resolution 360 steps/revolution corresponds to 76 - 435 range).

### Binary code

With this assessable output code, a precise valence with the potency (x) to the base 2 ( $2^x$ ) is assigned to each position value.

### BCD code (8-4-2-1 code)

This is an assessable decades code. Each decade of the decimal system is represented by a 4-bit binary number. The 6 redundant combinations (10-15) of the binary code are not used. They are also referred to as pseudo-tetradecades.

## Input

**Counting direction switchover** - The output of the position value facing the shaft clockwise is ascending with absolute rotary encoders. The counting direction is reversible via this output.

**Latch** - The output data of the absolute rotary encoder can be "frozen" via this input. This enables an error-free takeover of the position values to a control.

## Calculation of permissible speed

Depending on the max. step frequency of 10 kHz, the permissible speed is roughly calculated according to the following Formula:

$$n \left( \frac{u}{\min} = \frac{f_{\max} \text{ (Hz)}}{\text{Resolutions}} \right) \times 60$$

Attention: This calculation does not take into account the influence of the cable length; in addition, the permissible mechanical speed should be observed!!

## Output circuits

# Absolute Rotary Encoders

## Synchronous serial transmission (SSI) for absolute rotary encoders

Absolute rotary encoders are, in many cases, subject to severe mechanical stresses, electrical and magnetic fields contaminating the operating site. Special constructive measures are, therefore, required to combat dirt, dust and liquids in the industrial environment. Our absolute rotary encoders have a mechanically robust design according to the latest technologies, and the electronics are designed as compact as possible.

The main focus in the interference resistance applies to the data transmission from the rotary encoder to the control. The measuring data of the rotary encoder must be read error-free from the control. Under no circumstances should undefined data be transmitted, e.g. at the changeover point. The concept described here for synchronous serial data transfer for absolute rotary encoders differs essentially from the parallel and asynchronous serial transmission types by:

- fewer electronic components
- fewer cables for data transfer
- the same interface hardware, regardless of the resolution (word lengths) of the absolute rotary encoder
- galvanic isolation of the rotary encoder of the control by octocoupler
- line breakage monitoring by constant current
- data transfer rates up to 1.5 Mbit/s (depending on the cable length)
- Ring register operation possible

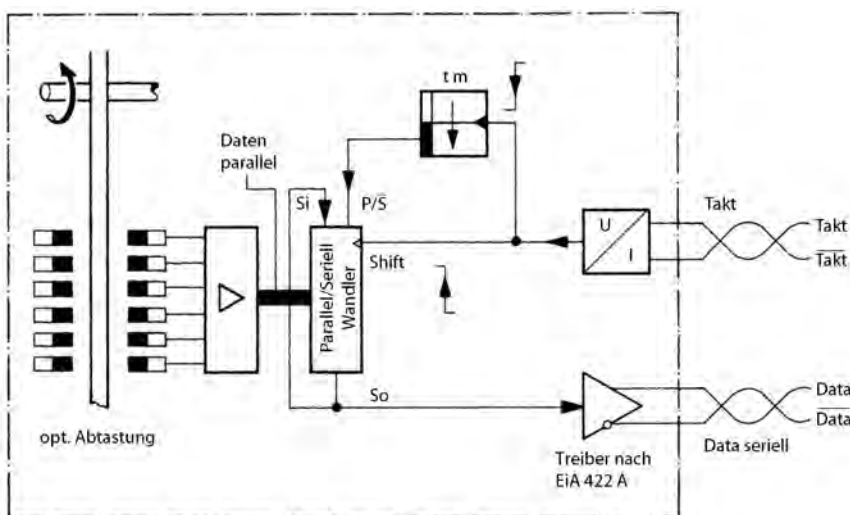

## Transfer procedure

For correct data transfer, it is necessary to apply a defined number of pulses (clock brushes) at the input of the absolute rotary encoder. A  $T_p$  pause must be observed thereupon. As long as no clock signal is applied to the rotary encoder, the encoder's internal parallel/serial shift register is switched to parallel. The data are free-running and correspond respectively to the position of the rotary encoder shaft. As soon as a clock brush is reapplied, the current angle information is stored.

The first change of the clock signal from high to low actuates the rotary encoder's internal retriggerable monoflop, whose  $t_m$  monoflop timeout must be greater than the period duration  $T$  of the clock signal.

The output of the monoflop controls the parallel/serial register via the P/S (parallel/serial) port.

Block diagram of an absolute rotary encoder

## Synchronous serial transfer

The number of clocks required for data transfer is independent of the resolution of the absolute rotary encoder. The cycle can be interrupted at any point, or continued for multiple queries in the ring register operation.

The first change of the clock signal from low to high b applies the most significant bit (MSB) of the angle information to the serial data output of the rotary encoder.

Each succeeding rising edge shifts the next least-significant bit to the data output. After transfer of the next least-significant bit (LSB), the alarm bit or other special bits are transferred, depending on the configuration. Then the data line switches from low c until the  $t_m$  time has elapsed.

Another data transfer can only be started when the data line is switched to high d again. If the clock change is not interrupted at the point c, the ring register operation is activated automatically. That is, the information stored during the first clock change is returned via the S0 port onto the serial input S1. As long as the cycle is not interrupted at c, the data can be read out as often as desired.

## Input circuit

## Output circuit

Driver according to EIA 422 A

## Recommended data transfer rate

The maximum data transfer rate depends on the cable length.

Cable length	Baud rate
< 50 m	< 400 kHz
< 100	< 300 kHz
< 200 m	< 200 kHz
< 400 m	< 100 kHz

# Series AWA 58

## Series AWA 58

- ▶ Absolute rotary-encoder with a solid shaft diameter of 6-12 mm and parallel output
- ▶ Housing diameter 58 mm, compact design and high degree of protection up to IP67
- ▶ Maximum resolution 10 Bit
- ▶ For highest industrial requirements
- ▶ Also available in stainless steel for aggressive environmental conditions
- ▶ Accessories from page 78

### Electrical specifications

max. pulse frequency:	25 kHz
Perm. temperature range:	-30°... +70° C
Power supply:	10 V... 30 V DC
Max. current consumption:	170 mA (without load)
Max. output load:	40 mA (per channel)

# Series AWA 90

## Series AWA 90

- ▶ Absolute rotary-encoder with a solid shaft diameter of 12 mm and parallel output
- ▶ Housing diameter 90 mm, compact design and high degree of protection
- ▶ Maximum resolution 12 Bit
- ▶ For highest industrial requirements
- ▶ Also available in stainless steel for aggressive environmental conditions
- ▶ Accessories from page 78

### Electrical specifications

Max. step frequency:	25 kHz
Perm. temperature range:	-30° ... +70° C
Power supply:	10 V ... 30 V DC
Max. current consumption:	160 mA (without load)
Max. output load:	40 mA (per channel)
Residual ripple:	max. $\pm 5\% U_B$

### Mechanical specifications

Flange:	Aluminium
Housing:	Powder-coated sheet steel
Shaft:	stainless steel
Shaft seal:	oil/salt-water resistant
Bearing:	Deep groove ball bearing
Weight:	approx 1,2 kg
Protection type:	IP 65
Max. speed:	6.000 U/min
Torque:	approx 5 Ncm
Max. shaft load:	axial 30 N/radial 50 N

# Series 72

## Functional description of the control inputs

Pin	Desc.	Explanation
25 *	Reset Acknowledgement Alarm	A signal (+ Ub) resets the internal counter. The alarm output is acknowledged at the same time.
24 *	Code Selection of output code	A signal (+ Ub) switches the code type from binary to BCD code
23 *	Change of counting direction	A signal (+ Ub) changes the counting direction. Looking at the shaft: Sequence of numbers increasing for an anticlockwise shaft)
22	Alarm/Relay output Unilateral mass of switching	When the internal battery no longer has sufficient voltage and counting errors could arise, this is indicated by resetting the output. Furthermore, the internal power supply is monitored during operation.

\* All control inputs are switched via octocoupler

## Functional description of alarm output: (after applying the operating voltage)

The counter is reset and the alarm output is acknowledged by resetting.

The alarm output is only set when the battery voltage has exceeded a certain value during actuation of the reset.

This depends on the battery discharge and can take a few minutes.

If the reset is controlled with a static signal of + Ub, the release of the count is signalled by setting the alarm output.

### Options:

Option1/Pin 21: Acknowledgement input for alarm signal independent of reset

Option2/Pin 21.22: Potential-free relay contact for alarm signal

 2) N.C. with resolution 16- or 20-bit

Electrical specifications

Supply voltage	10-30 V
Intrinsic current consumption	ST 200 mA/MT 300 mA
Interface	Parallel
Output code	Binary, Gray, Gray excess
Resolution singleturn	10-14-bit, depending on variant, 12-bit in MT design Gray excess: 360, 720 steps
Resolution multiturn	12-bit
Linearity	+/- 1/2 LSB
Output current	30 mA per bit Short-circuit-proof
Control inputs	Latch, Direction, Tristate by ST; Tristate by MT
Connection	Cable or flange receptacle, Conin 17-pol. Axial or radial, Sub D 37-pol.

Order reference

# Series BC 58

## BC 58 with SSI interface

### Synchronous serial transmission (SSI) for absolute rotary encoders

The SSI interface can be used for multiturn encoders with gray code or binary code. Furthermore, special bits (alarm signal, parity) can be attached to the data bits of the 24-bit encoder.

The SSI interface supports single and multiple transfers. For multiple transfer (the stored value is read out several times in succession), a fixed number of cycles per revolution must be observed (25 to 26 cycles for multiturn).

For multiple transfer, the distance between the clock brush must be below 10  $\mu\text{s}$  and for single transfer, it must be greater than 30  $\mu\text{s}$ . After the output of the last bit (alarm or parity), the data output for approx. 20  $\mu\text{s}$  is set to logic „0“, then to logic „1“. Then current encoder data can be read out again.

### Recommended data transfer rate for SSI

The maximum data transfer rate depends on the cable length.

Cable length	Baud rate
< 50 m	< 400 KHz
< 100 m	< 300 KHz
< 200 m	< 200 KHz
< 400 m	< 100 KHz

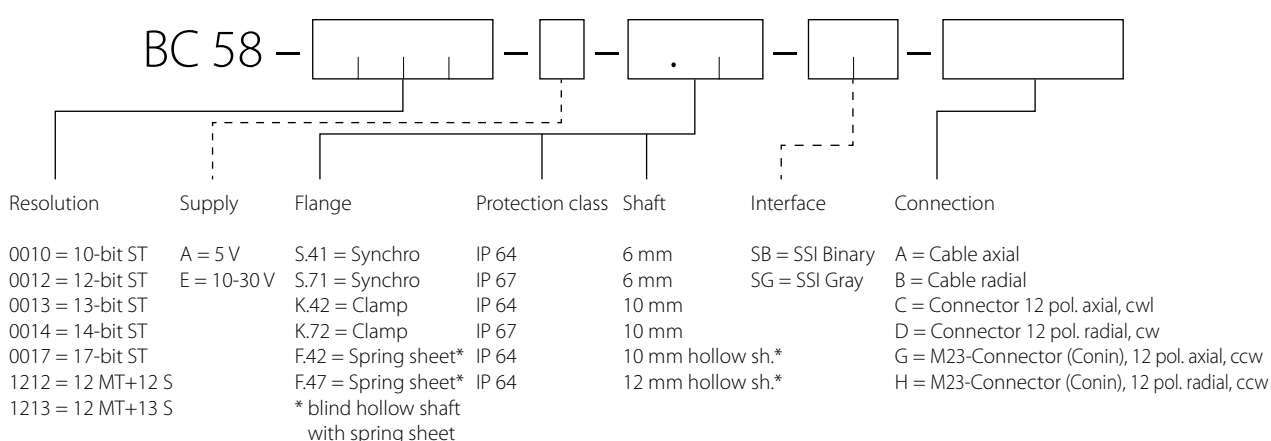

### Pin configuration SSI interface

Cable	Flange receptacle	Signal
brown (0.5 mm <sup>2</sup> )	1	0 V (supply voltage)
pink	2	Data
yellow	3	Cycle
	4	N.C.

# BC 58

## BC 58 with DeviceNet interface

Electrical	
Supply voltage	11-30 V DC
Intrinsic current consumption	Singleturn 220 mA/Multiturn 250 mA
Interface	CAN-Highspeed according to ISO/DIS 11898, CAN specifications 2.0 B
Certified	PNO
Programmable	According to class 2: Resolution, Preset*, Direction
Output code	Binary
Baud rate	Adjustable 125, 250, 500 Kbaud
Resolution singleturn	10 - 14-bit, depending on variant, 12-bit in MT design
Resolution multiturn	12-bit
Transfer mode	Polling mode (only upon request), Change of State (automatic with value change), Cyclical with adjustable cycle timer
Connection	Bus cover with 2 connectors, bus cover with 3-fold PG gland
Mechanical	
Operating temperature	- 40° C to + 85° C
Mass, approx.	Singleturn 350 g/Multiturn 400 g

\* Preset only via bus, no button

## Order reference

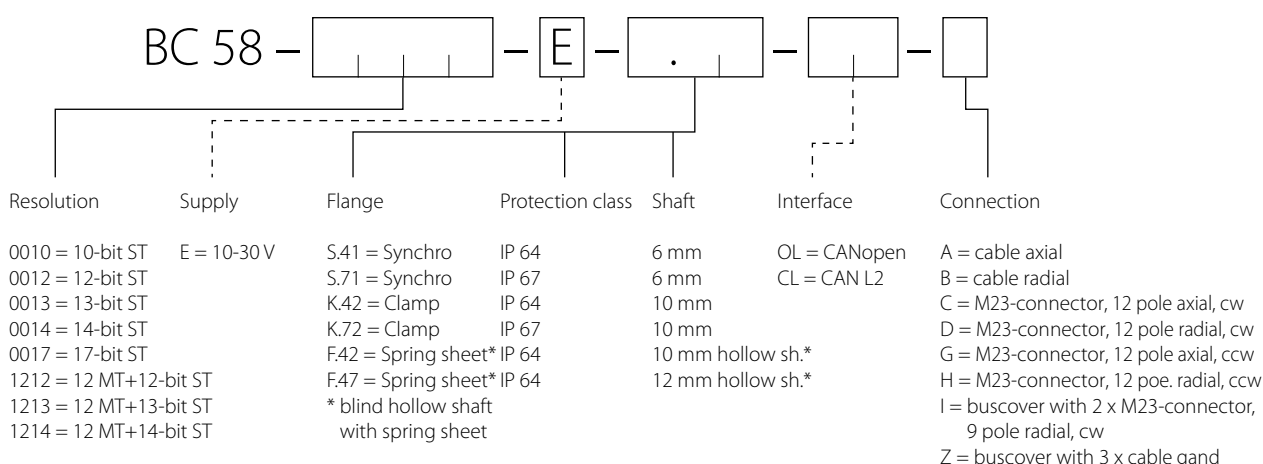

**BC 58 with CANopen/CAN Layer 2 interface**

Electrical	
Supply voltage	11-30 V DC
Intrinsic current consumption	Singleturn 220 mA/Multiturn 250 mA
Interface	CAN-Highspeed according to ISO/DIS 11898, Basic and Full CAN CAN specifications 2.0 B (11 and 29-bit identifier)
Profile	Profile CANopen according to Profile DSP 406, with additional functions
Programmable	CANopen: Direction, resolution, preset, offset, Limit values: CAN L2: Direction, limit values, binary
Output code	32-bit binary
Baud rate	Adjustable 10 to 1.000 Kbaud
Base identifier	Adjustable via DIP switch
Integrated special function	Speed, acceleration/rotary axle, limit values only CANopen
Resolution singleturn	Singleturn 10 - 14-bit, depending on variant, 12-bit in MT design
Resolution multiturn	12-bit
Transfer mode	Polling mode (only upon request), Change of State (automatically with value change), cyclical with adjustable cycle timer
Connection	Bus cover with 2 connectors, bus cover with 3-fold PG gland
Mechanical	
Operating temperature	- 40° C to + 85° C
Mass, approx.	Singleturn 350 g/Multiturn 400 g

**Order reference**

# Series HWA 103

## Series HWA 103

- ▶ Absolute singleturn rotary-encoder with a hollow shaft diameter of 10-25,4 mm, parallel- or SSI output
- ▶ Housing diameter 103 mm, small design and high degree of protection
- ▶ Maximum resolution 12 Bit
- ▶ Direct assembly onto existing shafts
- ▶ Also available in stainless steel for aggressive environmental conditions
- ▶ Accessories from page 78

### Electrical specifications

max. pulse frequency:	25 kHz
Perm. temperature range:	-30° ... +70° C
Power supply:	10 V ... 30 V DC
Max. current consumption:	160 mA (without load)
Max. output load:	40 mA (per channel)
Residual ripple:	max. $\pm 5\% U_B$

### Mechanical specifications

Flange:	Aluminium
Housing:	Aluminium
Hollow shaft:	stainless steel
Shaft seal:	oil/salt-water resistant
Bearing:	Deep groove ball bearing
Weight:	approx 0,8 kg
Protection type:	IP 65
Max. speed:	6.000 U/min
Torque:	approx 15 Ncm

### Installation instructions

Flange and shaft of encoder and drive may not be rigidly coupled at the same time!

### Please observe

All current standards for installing electrical systems in potentially explosive atmospheres must be observed during installation! Manipulations of the encoder (opening, mechanical processing) will lead to the loss of ex approval and guarantees! The installer assumes the consequential liability!

### Counting direction

Ascending code values during clockwise rotation of shaft. (facing the shaft)

### Max. permissible transfer rate for SSI

depending on the cable length

### SSI interface

### Functional description of the SSI interface

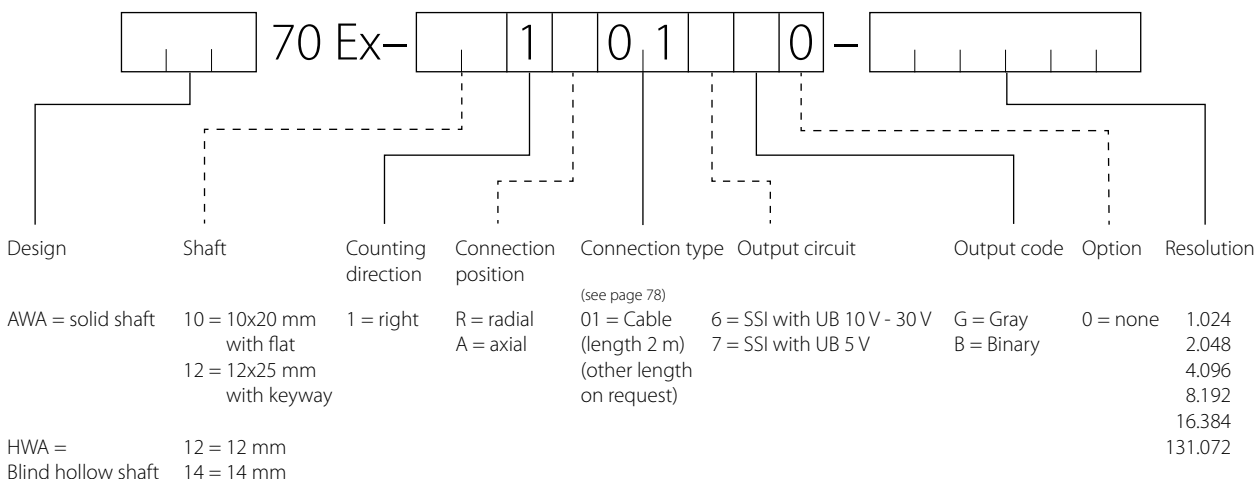

The cycle and data lines are at high level when in idle state. The first decreasing clock pulse edge signals the start of data transfer. The clock pulse edges increasing thereafter, transfer the data bit by bit, starting with MSB. The transfer of a complete data word requires n+1 increasing clock pulse edges (n=resolution in bit). The data line remains on low after the last positive clock pulse edge, until the encoder is ready again for a new data word. The cycle line must remain at least as long on high, and can subsequently start once again a new read-out sequence of the encoder with a decreasing edge.

**Please observe!** The data update is carried out synchronously with the read-out cycle. The data are thus as current as the time lag between two read-outs; a periodic read-out of the encoder is, therefore, recommended. After a longer read-out interval and simultaneous shaft rotation of the encoder, the data content of the first read-out can be "outdated" and should be ignored.

# Draw Wire Series EM

## Draw Wire Series EM

- ▶ Draw wire for incremental and absolute rotary-encoders
- ▶ 4 m, 8m or 10 m length
- ▶ Accessories from page 78

The ENCO-METER enables simple, quick and cost-effective adaptation of the rational signal recorders (encoder, potentiometer ...) to measure linear distances of up to 10 metres on slow moving machines without abrupt accelerations and with an average number of switching operations.

It consists of a stainless steel micro-cable with which its free end must be connected to the moveable component of the machine.

The other end of the cable is rolled up in a precision drum inside the device while a leaf spring always keeps it tensioned. The drum shaft can actuate any type of rotary/signal recorders.

By default, we have potentiometers with  $R = 10 \text{ k}\Omega$  and  $n = 10$  rotations in stock. It should be noted that the mechanical route of the potentiometer may restrict the measuring range of the ENCO-METER.

### Output devices

Upon request, we can deliver the ENCO-METER already mounted to an electronic output device, such as an incremental encoder, absolute encoder or potentiometer. If a specific resolution  $r$  (mm per pulse) is wanted in case of an absolute or incremental encoder, the number of pulses of the encoder ( $n$ ) is calculated as follows:

$$n = \frac{D}{r} \quad (D \text{ is the unrolling of the ENCO-METER in mm})$$

### Installation

The ENCO-METERS are mounted on a flat surface of the machine by means of 3 or 4 screws M4. Any mounting position may be used. The cable must be properly aligned ( $\alpha < 2^\circ$ ) and may, under no circumstances, exceed the measuring range. Using a potentiometer results in an output ratio  $r$  (in  $\Omega$  per mm) according to:

$$r = \frac{R}{D \times n} \quad (R \text{ is the nominal resistance and } n \text{ the number of rotations})$$

Torque supports

Mechanical dimensions

Installation instructions

In order to compensate axial and radial shaft run-out, as well as any angle set, the rotary encoder flange may not be rigidly secured. Fix the flange above a stator coupling (e.g. spring sheet) as torque support.

The following flexible fixing plates are available:

- |      |                                   |  |
|------|-----------------------------------|--|
| DS A | suitable for encoder type HWI 103 | Shaft offset max: +/- 2.0 mm axial, +/- 0.15 mm radial |
| DS N | suitable for encoder type HWI 80  | Shaft offset max: +/- 0.5 mm axial, +/- 0.3 mm radial  |

## Mounting bell

For series AWA 58, AWI 58, AWI 58 H,  
BC 58, PS & PSM

The mounting bell MOGL 5038 provides a very simple and inexpensive installation for all encoders with a synchro flange. The mounting bell made of fibreglass-reinforced plastic in injection moulding technology has a thermally and electrically insulating effect.

The encoder is mounted optionally onto the bell with 3 screws M4 x 10 DIN 912 or 3 mounting eccentrics

# Assembly and Installation Instructions

## Assembly and installation instructions

Hohner rotary encoders can be used both in simple industrial applications, as well as toughest environmental conditions, depending on the type and design.

The precision and optoelectronic components used in an incremental or absolute encoder today no longer present a problem regarding the above-mentioned applications. However, in order to ensure proper functioning of your rotary encoder, the following assembly and installation instructions should be observed:

### Electrical:

- ▶ When wiring or pulling the plug, it is essential to ensure absence of voltage.
- ▶ Static discharges at the connections may cause damage.
- ▶ The shielded cable must be connected to the PE in the control cabinet (the shield is not connected in the device, i.e. unilateral shielding).
- ▶ Unused cables should be connected on a floating basis isolated from each other.
- ▶ Do not lay the encoder cable parallel or near the load lines.
- ▶ The tests carried out according to the certificate of conformity were performed in the standard version with 2 m cable.

### Mechanical:

- ▶ It is imperative to avoid blows to the shaft.
- ▶ The maximum shaft load may not be exceeded.
- ▶ An axial or radial shaft misalignment must be compensated through suitable measures, such as through the use of couplings, torque supports, belt drive, or similar.
- ▶ The device may not be mechanically modified.
- ▶ When using hollow shaft encoders, a distortion-free installation should be ensured.

These are just some instructions for which observance thereof can avoid problems during the application of encoders. Should any questions arise during the assembly or installation of Hohner rotary encoders, our expert staff will be at your disposal with advice and practical support.

# Declaration of conformity

## EC declaration of Conformity

Hohner Elektrotechnik GmbH  
Gewerbehof 1  
D – 59368 Werne

In compliance with the standard 2014/30/EU which states the Electromagnetic Compatibility and 2014/35/EU which states the Electrical Safety, guarantees that the products of series:

20, AWI40 with "C", AWI58, AWI58H, PR90, PMS, AWI90, AWI90 Redundant, PH05, PA02, 27, 21, 24, 28, 29, H, HC, 66, TR, HWI40, HWI58, SWI58, PR90H, HWI80, HWI103, MIG Nova+, 25, PEH, PT, BS, BSP, BSC, PR, PL, RI76TD, PM, PK, AWA58, BC58, PS, PSM, AWA90, 70-140, 72, R, S, SM, SS, SSM, MS, MM, TS, TM, SWA90, HWA103, AS, ASP, ASC, MAS, SAS, SAM, PRA, PZL, HP, HPC, HPH, 3000, 55, 08, NAMFPX, 14, MXE, CS30, CSRXE, CSMXE, AWI70Ex, HWI70Ex, AWA70Ex, HWA70Ex, E, NAMYQX, W, IP300, 85, RXE, RXL, MXL, CMMXE, DLS-001, PTS-001, CHM-001, SUBCWD, INHO,

meet the requirements:

2014/30/EU	Electromagnetic Compatibility
2014/35/EU	Electrical Safety

according to the relevant standard below mentioned:

EN-61000-6-2:2006-03	Generic Standards – Immunity for industrial environments
EN-61000-6-4:2011-09	Generic Standards – Emission standard for industrial environments
EN-55011:2011-04	Conducted and radiated emissions

# General sales conditions

## General sales conditions no. 4

### General

The following general sales conditions apply exclusively to all transactions between us and our business partners, even if different conditions are stipulated or prescribed to us. All orders placed by travelling staff or representatives require our written consent to be valid.

### Prices

The prices are deemed ex works, strictly net, without packaging costs and the like; they are always subject to change.

### Delivery time

Any agreed dates and periods are always considered as estimates. We reserve the right to withdraw from the contract should circumstances arise changing the conditions existing at the time of the offer, order or order confirmation. For such cases, we have, at our own discretion, the right to adhere to the contract and charge the current price for the goods valid at the time of delivery.

### Shipment

Shipment always takes place, even with post-paid deliveries, at the expense and risk of the buyer. Insurance for damages in transit is made at the request and expense of the buyer. However, we reserve the right to insure the shipment in whole or part at the expense of the buyer, without obligation to do so. For reports of damage to shipments insured through us, the terms and deadlines of the respective carrier and insurance companies apply.

### Packaging

The packaging of the goods is, unless otherwise agreed, determined at our discretion. We reserve the right to charge, besides the value calculation, a deposit for special packaging. Packaging is charged at cost price and will not be taken back.

### Payment

Place of performance for deliveries and payment is for all current and future orders Werne. Payments shall be made, unless otherwise agreed, net 30 days after the invoice date, without any deduction free of charge to Werne. The date of settlement is the date upon which the amount is at our disposal. For payments within 8 days after the invoice date, we grant a 2% cash discount. In the case of delayed payment, a 3% default interest will be charged above the legal bank discount, while reserving the right to assert claims for higher compensation.

Upon deterioration of the buyer's ability to pay or after receiving unfavourable information about him, we have the right to demand advance payment of sufficient security of the invoice amounts, even if other conditions are provided or agreed upon. In these cases, unpaid bills are payable immediately. The same applies if the buyer mortgages stocks, accounts receivables, etc. or purchases goods as security for other creditors, or fails to pay despite repeated reminders. Retention or offset with any claims by the buyer against our payment entitlement is excluded.

### Reservation of title

The delivered goods remain our property until the purchase price is paid in full and until payment of all previous and future deliveries within the business relations, including all secondary claims (if payment is made by a bill of exchange, until the discharge of the check or bill). The buyer is hitherto not entitled to pledge the goods to third parties or transfer them by way of security. The ruling rights of sale during the ordinary course of business remains unaffected. In the event of resale, it is agreed that the reservation of title to the resold goods are forwarded from the buyer to the new buyer or new seller. The proceeds from the resale should be kept separately in our behalf. The buyer herewith assigns all claims against a third party resulting from the resale or any other legal reason to us for our security. The buyer is authorised to collect these claims on our account as long as the buyer meets his payment obligations to us in due course. We are, however, entitled to inform the buyer (third party), to be identified upon request, of the transferral of the claim, and issue instructions. The buyer must inform us immediately of any access by third parties to the goods supplied under reservation of title or assigned claims. The right of title is also valid against the carrier to whom the goods are handed over at the request of the buyer or on our commission.

### Custom-made products

For custom-made products, we have the right to demand total or partial advance payment. For mass-produced articles we are entitled to carry out excess or short deliveries of 20% and partial deliveries.

Tools always remain our property, even if the buyer has paid them in whole or part.

It is exclusively up to the buyer to ensure that the goods commissioned do not violate the property right of third parties. The buyer thereby assumes full responsibility for any claim towards us.

### Complaints

Complaints must be reported to us in writing immediately after discovery. Should we not receive a specified notice of defects by the buyer within 4 weeks after

receipt of the goods at the address location, namely at the postal, or railway station, or receiving forwarded, or air freight, sea port agency, etc. of the address location, quality and quantity, etc. are deemed to be approved under relinquishment of any right to complaint relating to apparent or allegedly concealed defects. For any goods delivered by us proving to be defective, after unchanged receipt of goods free of charge, provided timely and formally correct submission of the complaint, we may, at our discretion, provide either free replacement, or repair, or refund the value of the goods at the current price at the time of receipt by us. Any further claims of the buyer or third party are expressly excluded in any case.

Tolerance ranges shall be deemed as accepted according to the respective state of the art technology, unless special agreements have been explicitly agreed.

### Warranty terms

Regarding deficiencies of the delivery, including the absence of expressly warranted characteristics, we shall be liable in such a way that we will repair or replace at our discretion all parts which prove useless or considerably impaired in their usefulness, within 6 months (3 months for shift operations) since the delivery date (day we dispatched). We shall only be liable for material defects where reasonable care should have led us to recognise the defects. Any further claims of any kind of the buyer or third party are expressly excluded in any case. The buyer shall bear any costs incurred by us arising from unjustified notices of defect.

We must be notified in writing of any complaints immediately after discovery and concerned parts should be submitted upon request. The complaint period ends at the latest upon expiry of the 7th month since the day of delivery (day we dispatched).

The buyer shall afford us the necessary time and opportunity to undertake all the changes deemed necessary to supply spare parts. Replaced delivery items shall become our property.

No liability shall be assumed: a) for damage resulting from normal wear; b) as long as the buyer has not fulfilled his obligations towards us, especially the agreed conditions of payment; c) when the buyer carries out modifications and repairs without our authorisation.

Tolerance ranges shall be deemed as accepted according to the respective state of the art technology, unless special agreements have been explicitly agreed.

We have carefully checked all the information in this catalogue (technical data, illustrations, dimensions, etc.) and they are based on our knowledge and production status at the time of printing. They do not, however, represent binding assurance.

### Place of jurisdiction

The relationship between us and our clients is governed by German law. Place of jurisdiction for everything arising from the delivery contract
